Unit 2.2

#2 Suppose that A is the set of sophomores at your school and B is the set of students in discrete mathematics at your school. Express each of these sets in terms of A and B.

a) the set of sophomores taking discrete mathematics in your school

 $A\cap B$

b) the set of sophomores at your school who are not taking discrete mathematics

A - B or $A \cap B^c$

c) the set of students at your school who either are sophomores or are taking discrete mathematics

 $A\cup B$

d) the set of students at your school who either are not sophomores or are not taking discrete mathematics

```
(A \cap B)^c
```

Given $A \cap B = \{3, 6, 9\}$, we also know that $A \cap B^c = \{1, 5, 7, 8\}$.

$$(A \cap B) \cup (A \cap B^c) = A \cap (B \cup B^c)$$
$$= A \cap U$$
$$= A$$

Given this, we can conclude that $A = \{1, 3, 5, 6, 7, 8, 9\}$. Given A, we can conclude that $B = \{2, 3, 6, 9, 10\}$.

#20 Let A, B and C be sets. Show that,

a)
$$(A \cup B) \subseteq (A \cup B \cup C)$$

 $(A \cup B) \implies \forall x, x \in A \lor x \in B$
 $= \forall x, x \in A \lor x \in B \lor x \in C$
 $= \forall x, x \in (A \cup B \cup C)$

$$\therefore (A \cup B) \subseteq (A \cup B \cup C)$$

d) $(A - C) \cap (C - B) = \emptyset$

$$\begin{split} (A-C) \cap (C-B) \subset (A \cap C^c) \cap (C \cap B^c) \\ \subset A \cap B \cap (C^c \cap C) \\ \subset A \cap B \cap \emptyset \\ \subset \emptyset \end{split}$$

The empty set is a subset of every set, so we can conclude that $(A - C) \cap (C - B) = \emptyset$.

e)
$$(B - A) \cup (C - A) = (B \cup C) - A$$

First, $(B - A) \cup (C - A) \subset (B \cup C) - A$.

$$x \in (B - A) \cup (C - A)$$

$$x \in (B - A) \lor x \in (C - A)$$

$$x \in B \cap A^c \lor x \in C \cap A^c$$

$$(x \in B \land x \notin A) \lor (x \in C \land x \notin A)$$

$$(x \in B \lor x \in C) \land (x \notin A)$$

$$(x \in B \cup C) \land (x \notin A)$$

$$x \in (B \cup C) \cap A^c$$

$$x \in (B \cup C) - A$$

$$\therefore (B - A) \cup (C - A) \subset (B \cup C) - A$$

Then, $(B - A) \cup (C - A) \supset (B \cup C) - A$.

$$x \in (B \cup C) - A$$
$$x \in (B \cup C) \land x \notin A$$
$$(x \in B \lor x \in C) \land (x \notin A)$$
$$(x \in B \land x \notin A) \lor (x \in C \land x \notin A)$$
$$x \in B \cap A^c \lor x \in C \cap A^c$$
$$x \in (B - A) \lor x \in (C - A)$$
$$x \in (B - A) \cup (C - A)$$
$$\therefore (B - A) \cup (C - A) \supset (B \cup C) - A$$

Since we have proved either set is a subset of the other, we can conclude that $(B - A) \cup (C - A) = (B \cup C) - A$.

#54 Let
$$A_i = \{\dots, -2, -1, 0, 1, \dots, i\}$$
. Find
a) $\bigcup_{i=1}^{n} A_i$
 $\bigcup_{i=1}^{n} A_i = \{\dots, -2, -1, 0, 1, \dots, n\}$
 $= \{x \in \mathbb{Z} \mid x \le n\}$
 $= A_n$
b) $\bigcap_{i=1}^{n} A_i$

$$\bigcap_{i=1}^{n} A_{i} = \{\dots, -2, -1, 0, 1\}$$
$$= \{x \in \mathbb{Z} \mid x \le 1\}$$
$$= A_{1}$$

Unit 2.3

#2 Determine whether f is a function from \mathbb{Z} to \mathbb{R} if

- a) $f(n) = \pm n$. Since a function cannot map to a single input, n, to two different outputs, n and -n, this is not a function.
- b) $f(n) = \sqrt{n^2 + 1}$ This is a function, since for every input, n, there is only one output, $\sqrt{n^2 + 1}$, which is guaranteed to be a real number as for all integers, $n^2 + 1 \ge 1$.
- c) $f(n) = \frac{1}{n^2 4}$ This is not a function from \mathbb{Z} to \mathbb{R} , since $n^2 4 = 0$ when $n = \pm 2$, and thus f(n) is undefined for $n = \pm 2$.

#6 Find the domain and range of each of these functions.

a) the function that assigns to each pair of positive integers the first integer of the pair

```
Domain: \mathbb{Z}^+ \times \mathbb{Z}^+
Range: \mathbb{Z}^+
```

d) the function that assigns to each positive integer the largest integer not exceeding the square root of the integer

```
Domain: \mathbb{Z}^+
Range: \mathbb{Z}^+
```

#10 Determine whether each of these functions from $\{a, b, c, d\}$ to itself is one-to-one.

- a) f(a) = b, f(b) = a, f(c) = c, f(d) = d Yes, every output has a unique input.
- b) f(a) = b, f(b) = b, f(c) = d, f(d) = c No, b can be produced by both a and b.
- c) f(a) = d, f(b) = b, f(c) = c, f(d) = d No, d can be produced by both a and d.

#16 Consider these functions from the set of students in a discrete mathematics class. Under what conditions is the function one-to-one if it assigns to a student his or her

a) mobile phone number.

The function is one-to-one if no students share a phone number, which is expected.

b) student identification number.

The function is one-to-one if no students share an ID number, which is expected.

- c) final grade in the class. The function is one-to-one iff no students share a final grade in the class.
- d) home town. The function is one-to-one iff no students share a home town.

#26

a) Prove that a strictly increasing function from $\mathbb R$ to itself is one-to-one.

Proof. Lets take the strictly increasing function f(x) = x + 2. We can prove that this function is one-to-one by proving that for all $x, y \in \mathbb{R}$, $f(x) = f(y) \implies x = y$.

$$f(x) = f(y)$$
$$x + 2 = y + 2$$
$$x = y$$

b) Give an example of an increasing function from $\mathbb R$ to itself that is not one-to-one.

The piecewise function, $f(x) = \begin{cases} 0 & x \le 0 \\ x & x > 0 \end{cases}$ is increasing, but not one-to-one as any two inputs less than or equal to 0 will produce the same output, 0.
